[The algorithm in Sonis used to calculate weighted averages.](#)

- Select '**Course Management**' then '**Gradebook**'

The screenshot shows the Eureka College Gradebook interface. At the top, it says "Eureka College" and "MARCH 22, 2016". The main heading is "Gradebook". Below this, there are dropdown menus for "School Year" (201516) and "Semester" (Spring). Underneath, there is a "Course Section" dropdown menu showing "BIO142 :1". The course title is "PRINCIPLES OF BIO II-(BIO142)". There are three main sections: "COURSE LINKS" with buttons for "BROWSE GRADES", "SECTION SETUP", "FORUM", and "ROSTER PDF"; "COURSE DETAIL" showing "Section : 1", "Start Date : 01/19/2016", and "End Date : 05/10/2016"; and "COURSE SCHEDULE" listing days and times: "Monday : 11:00am - 11:50am Room : S-206", "Wednesday : 11:00am - 11:50am Room : S-206", and "Friday : 11:00am - 11:50am Room : S-206". At the bottom, there is a "MY GRADEBOOK DATE RANGE" button and "Weighting Scale : Bio 142".

- Verify the **School Year** and **Semester** and the **Course: Section** shown are correct
  - If necessary, select different School Year, Semester and/or Course: Section from the Drop Down lists provided.
  - There is no submit button for changing the school year, semester and Course Section. When you change a value in one of the drops, the resulting output is instantly shown.

## The algorithm in Sonis used to calculate weighted averages.

Two methods are available. Currently we use the first method.

1. Assumes that all scores for a given weighting element should be counted equally regardless of the possible score. In other words, all scores posted for Quizzes are averaged together and then multiplied by the weight assigned to Quizzes.

For example let's say Quizzes were assigned a weighting of 25% and Tests a weighting of 75% and there were three scores posted for the Quizzes element as follows:

Quiz 1 has a possible score of 100

Quiz 2 has a possible score of 30

Quiz 3 has a possible score of 100

The student got an 80 on Quiz 1, a 30 on Quiz 2 and a 67 on Quiz 3. The algorithm for calculating the Quizzes component of the overall weighted average would be:

$$[(80/100) + (30/30) + (67/100)]/3 * 0.25 = 175/3 * 0.25 = 0.20583$$

2. An alternate approach is that each score should not be factored in equally by converting it to a decimal average based on the possible score but that the total of the scores should be divided by the total of the possible points:

$$[(80 + 30 + 67) / (100 + 30 + 100)] * 0.25 = 0.19239$$

The argument is that this approach factors in the difference in possible points based on the assumption that a 100 point quiz should count more than a 30 point quiz.
